## HW07 Code

## HashTagTokenizer.java:

```
public class HashTagTokenizer {
   public static void main(String[] args) {
       String hashTag = args[0];
       String []dictionary = readDictionary("dictionary.txt");
       breakHashTag(hashTag, dictionary);
   public static String[] readDictionary(String fileName) {
       String[] dictionary = new String[3000];
       In in = new In(fileName);
       for (int i = 0; i < 3000; i++) {
           dictionary[i] = in.readLine();
       return dictionary;
   public static boolean existInDictionary(String word, String
[]dictionary) {
           if (dictionary[i].equals(word)) {
   public static void breakHashTag(String hashtag, String[] dictionary) {
```

```
// Base case: do nothing (return) if hashtag is an empty string.
if (hashtag.isEmpty()) {
    return;
}

int N = hashtag.length();
String newString = "";

for (int i = 1; i <= N; i++) {
    newString = hashtag.substring(0,i);
    if (existInDictionary(newString, dictionary)) {
        System.out.println(newString);
        breakHashTag(hashtag.substring(i), dictionary);
        break;
    }
}
</pre>
```

## SpellChecker.java:

```
public static void main(String[] args) {
       String word = args[0];
       int threshold = Integer.parseInt(args[1]);
       String[] dictionary = readDictionary("dictionary.txt");
       String correction = spellChecker(word, threshold, dictionary);
       System.out.println(correction);
   public static String tail(String str) {
       return str.substring(1);
   public static int levenshtein(String word1, String word2) {
       if (word1.length() == 0) {
           return word2.length();
       }else if (word2.length() == 0) {
           return word1.length();
(word1.substring(0,1).equalsIgnoreCase(word2.substring(0,1))) {
           return levenshtein(tail(word1), tail(word2));
           int[] options = new int[3];
           options[0] = levenshtein(tail(word1), word2);
           options[1] = levenshtein(word1, tail(word2));
           options[2] = levenshtein(tail(word1), tail(word2));
               if (options[i] < minimum) {</pre>
                   minimum = options[i];
```

```
public static String[] readDictionary(String fileName) {
        String[] dictionary = new String[3000];
            dictionary[i] = in.readLine();
        return dictionary;
    public static String spellChecker(String word, int threshold, String[]
dictionary) {
        int limit = threshold + 1;
        for (int i = 0; i < dictionary.length; i++) {</pre>
            if (levenshtein (word, dictionary[i]) < limit) {</pre>
                limit = levenshtein (word, dictionary[i]);
                newWord = dictionary[i];
        return newWord;
```
